

Hello! This is my first L^AT_EX document.
A rectangle has side lengths of $(x + 1)$ and $(x + 3)$.
The equation

$$A(x) = x^2 + 4x + 3$$

gives the area of the rectangle. To start a new paragraph we use a hard return by insert a blank line in between (like how I just do).

If you want to type in the same paragraph you have to use the soft return and that by ending the previous line of code with double slash (Just like how I did with the previous line).

You can turn indenting off in your document by use `{\parindent 0px}`:
This is the first sentence.
This is the second sentence without inserting a blank line.

And you can change the distance of the indenting by increasing the px number.

There three ways to insert (Horizontal line)

For a simple horizontal line type `\hrule`

You can use `\bigskip` to insert lines around the horizontal line. Horizontal line of a specified thickness

Controlling the horizontal line width

(Without `\`) 

(With `\`)
